## SDK setup and configuration

npm

CDN

Config

If you're already using [npm](#) and a module bundler such as [webpack](#) or [Rollup](#), you can run the following command to install the latest SDK ([Learn more](#)):

```
$ npm install firebase
```

Then, initialize Firebase and begin using the SDKs for the products you'd like to use.

```
// Import the functions you need from the SDKs
import { initializeApp } from "firebase/app";
import { getAnalytics } from "firebase/analytics";
// TODO: Add SDKs for Firebase products that you want to use
// https://firebase.google.com/docs/web/setup#

// Your web app's Firebase configuration
// For Firebase JS SDK v7.20.0 and later, measurementId is optional
const firebaseConfig = {
  apiKey: "AIzaSyCdfnWg6bFV-zLX7Vugj1Ljd-useoJ",
  authDomain: "kirthi----project.firebaseio.com",
  databaseURI: "https://kirthi----project-default-rtdb.firebaseio.com",
  messagingSenderId: "1018951111111",
  projectId: "kirthi----project",
  storageBucket: "kirthi----project.appspot.com",
  analytics: false
};
```

## settings

```
appId: "1:577010252500:web:a02047dee40509d1e",
measurementId: "G-R9RPWRT90T"
};

// Initialize Firebase
const app = initializeApp(firebaseConfig);
const analytics = getAnalytics(app);
```

**Note:** This option uses the [modular JavaScript SDK](#), which provides reduced SDK size.
